

# Package ‘GPFDA’

January 10, 2021

**Type** Package

**Title** Gaussian Process Regression for Functional Data Analysis

**Version** 3.0.0

**Date** 2021-01-09

**Author** Jian Qing Shi, Yafeng Cheng, Evandro Konzen

**Maintainer** GPFDA's authors <gpfdar@gmail.com>

**Description** Functionalities for modelling functional data with multidimensional inputs, multivariate functional data, and non-separable and/or non-stationary covariance structure of function-valued processes. In addition, there are functionalities for functional regression models where the mean function depends on scalar and/or functional covariates and the covariance structure depends on functional covariates. The development version of the package can be found on <<https://github.com/gpfda/GPFDA-dev>>.

**License** GPL (>= 2)

**Depends** R (>= 3.6)

**Imports** Rcpp (>= 1.0.2), splines, mgcv, MASS, mvtnorm, fields, interp, stats, graphics, grDevices, fda, fda.usc

**LinkingTo** Rcpp, RcppArmadillo

**RoxygenNote** 7.0.2

**Encoding** UTF-8

**Suggests** knitr, rmarkdown

**VignetteBuilder** knitr

**LazyData** true

**NeedsCompilation** yes

calcScaleDistMats	<i>Calculate matrices for NSGP covariance function</i>
-------------------	--

---

**Description**

Calculates matrices 'ScaleMat' and 'DistMat', which are used to obtain NSGP covariance matrices

**Usage**

calcScaleDistMats(A\_List, coords)

**Arguments**

- A\_List           List of anisotropy matrices
- coords           Matrix of input coordinates (covariates)

**Value**

A list of ScaleMat and DistMat matrices

**Examples**

```
## See examples in vignette:
# vignette("nsgpr", package = "GPFDA")
```

---

co2	<i>co2: data set for a real data example</i>
-----	--

---

**Description**

A data.frame containing monthly CO2 data and annual average for each year. The original data has a sample size of 612, but the 5 of them which are missing was removed from our sample.

**Usage**

```
co2
```

**Format**

A data frame with 13 columns (12 months and the annual average) and 51 rows (number of years).

**Details**

Data used in the real data example, see vignette("co2"). It is obtained from <https://cdiac.ess-dive.lbl.gov/ftp/trends/co2/maunaloa.co2>. Atmospheric CO2 values (ppmv) derived from in situ air samples collected at Mauna Loa, Hawaii, USA.

---

covMat	<i>Calculate a covariance matrix</i>
--------	--------------------------------------

---

**Description**

Evaluates one of the following covariance functions at input vectors  $t$  and  $t'$ :

- Powered exponential
- Rational quadratic
- Matern
- Linear

**Usage**

```
cov.pow.ex(hyper, input, input.new = NULL, gamma = 2)

cov.rat.qu(hyper, input, input.new = NULL)

cov.matern(hyper, input, input.new = NULL, nu)

cov.linear(hyper, input, input.new = NULL)
```

### Arguments

hyper	The hyperparameters. It must be a list with certain names. See details.
input	The covariate $t$ . It must be either a matrix, where each column represents a covariate, or a vector if there is only one covariate.
input.new	The covariate $t'$ . It also must be a vector or a matrix. If NULL (default), 'input.new' will be set to be equal to 'input' and the function will return a squared, symmetric covariance matrix.
gamma	Power parameter used in powered exponential kernel function. It must be $0 < \text{gamma} \leq 2$ . Default to 2, which gives the squared exponential covariance function.
nu	Smoothness parameter of the Matern class. It must be a positive value.

### Details

The names for the hyperparameters should be:

- "pow.ex.v" and "pow.ex.w" (powered exponential);
- "rat.qu.v", "rat.qu.w" and "rat.qu.a" (rational quadratic);
- "matern.v" and "matern.w" (Matern);
- "linear.i" and "linear.a" (linear);
- "vv" (Gaussian white noise).

### Value

A covariance matrix

### References

Shi, J. Q., and Choi, T. (2011), "Gaussian Process Regression Analysis for Functional input", CRC Press.

---

D2

---

*Second derivative of the likelihood*

---

### Description

Calculate the second derivative of the likelihood function with respect to one of the hyperparameters, given the first and second derivative of the kernel with respect to that hyperparameter.

### Usage

```
D2(d1, d2, inv.Q, Alpha.Q)
```

**Arguments**

d1	First derivative of the kernel function with respect to the required hyperparameter.
d2	Second derivative of the kernel function with respect to the required hyperparameter.
inv.Q	Inverse of covariance matrix Q.
Alpha.Q	This is $\alpha * \alpha' - \text{inv}Q$ , where $\text{inv}Q$ is the inverse of the covariance matrix Q, and $\alpha = \text{inv}Q * Y$ , where Y is the response.

**Details**

The function calculates the second derivative of the log-likelihood, using the first and second derivative of the kernel functions.

**Value**

A number.

**References**

Shi, J. Q., and Choi, T. (2011), “Gaussian Process Regression Analysis for Functional Data”, CRC Press.

**Examples**

```
## This function is used in the vignette 'co2':
# vignette("co2", package = "GPFDA")
```

---

dataExampleGPFR	<i>Data simulated in the GPFR example</i>
-----------------	---

---

**Description**

A list containing training and test data simulated from a functional regression model.

In the training set, there are M=20 independent realisations and the functional response and the functional covariate are observed on a grid of n=20 time points.

The test set includes a single realisation observed on a grid of n\_new=100 time points.

Both training and test sets also have a scalar covariate.

**Usage**

```
dataExampleGPFR
```

**Format**

A list with seven elements:

**tt** A vector of length 50

**response\_train** A (20 x 50) matrix

**x\_train** A (20 x 50) matrix

**scalar\_train** A (20 x 2) matrix

**t\_new** A vector of length 100

**response\_new** A vector of length 100

**x\_new** A vector of length 100

**scalar\_new** A (1 x 2) matrix

**Details**

Data used in the GPFR example, see vignette("gpfr").

---

distanceMatrix	<i>Calculate generalised distances</i>
----------------	--

---

**Description**

Calculate the generalised distance between vectors  $t$  and  $t'$  using an anisotropy matrix  $A$ .

- distMat and distMatSq calculate:

$$[(t - t')^{p/2}]^T A (t - t')^{p/2}$$

- distMatLinear and distMatLinearSq calculate:

$$t^T A t'$$

**Usage**

```
distMat(input, inputNew, A, power)
```

```
distMatSq(input, A, power)
```

```
distMatLinear(input, inputNew, A)
```

```
distMatLinearSq(input, A)
```

**Arguments**

input	Vector of the input coordinate $t$
inputNew	Vector of the input coordinate $t'$
A	Anisotropy matrix $A$
power	Power value $p$

**Details**

The `distMatSq` and `distMatLinearSq` functions are used when input vectors  $t$  and  $t'$  are identical, returning a symmetric matrix.

When `distMat` and `distMatSq` functions are used in powered exponential kernels, `power=1` gives the exponential kernel and `power=2` gives the squared exponential one.

`distMatLinear` and `distMatLinearSq` functions are used in the linear covariance kernel.

**Value**

A matrix

---

GPFDA

*GPFDA: A package for Gaussian Process Regression for Functional Data Analysis*

---

**Description**

Gaussian Process Regression for Functional Data Analysis

**Details**

The main functions of the package are:

**gpr** Gaussian process regression using stationary separable covariance kernels.

**nsgpr** Gaussian process regression using nonstationary and/or nonseparable covariance kernels.

**mgpr** Multivariate Gaussian process – regression for multivariate outputs.

**gpfr** Functional regression model given by

$$y_m(t) = \mu_m(t) + \tau_m(x) + \epsilon_m(t),$$

where  $m$  is the  $m$ -th curve or surface;  $\mu_m$  is from functional regression; and  $\tau_m$  is from Gaussian Process regression with mean 0 covariance matrix  $k(\theta)$ .

**Author(s)**

Jian Qing Shi, Yafeng Cheng, Evandro Konzen

**References**

Shi, J. Q., and Choi, T. (2011), “Gaussian Process Regression Analysis for Functional Data”, CRC Press.

**Description**

Use functional regression (FR) model for the mean structure and Gaussian Process (GP) for the covariance structure.

Let 'n' be the number of time points 't' of functional objects and 'nrep' the number of independent replications in the sample.

**Usage**

```
gpfr(
  response,
  time = NULL,
  lReg = NULL,
  fReg = NULL,
  fyList = NULL,
  fbetaList_l = NULL,
  fxList = NULL,
  concurrent = TRUE,
  fbetaList_f = NULL,
  fbetaList = NULL,
  gpReg = NULL,
  hyper = NULL,
  NewHyper = NULL,
  Cov = "pow.ex",
  gamma = 2,
  nu = 1.5,
  useGradient = T,
  rel.tol = 1e-10,
  trace.iter = 5,
  fitting = FALSE
)
```

**Arguments**

response	Response data. It can be an 'fd' object or a matrix with 'nrep' rows and 'nrep' columns.
time	Input 't' of functional objects. It is a numerical vector.
lReg	Scalar covariates for the FR model. It should be a matrix with 'nrep' rows.
fReg	Functional covariates for the FR model. It can be a matrix with 'nrep' rows, or an 'fd' object, or a list of matrices or 'fd' objects.
fyList	A list to control the smoothing of response.

fbetaList_l	A list to control the smoothing of the regression coefficient function of the scalar covariates in the FR model.
fxList	A list to control the smoothing of functional covariates in the FR model.
concurrent	Logical. If TRUE (default), concurrent functional regression will be carried out; otherwise, the full functional regression will be carried out.
fbetaList_f	A list to control the smoothing of the regression coefficient function of functional covariates in the FR model.
fbetaList	A list to control the smoothing of functional covariates in the FR model with scalar response and functional covariates.
gpReg	Covariates in the GP model. It should be a matrix, an 'fd' object, a list of matrices or a list of 'fd' objects.
hyper	Vector of initial hyperparameters. Default to NULL.
NewHyper	Vector of names of new hyperparameters from the customized kernel function.
Cov	Covariance function(s) to use. Options are: 'linear', 'pow.ex', 'rat.qu', and 'matern'. Default to 'power.ex'.
gamma	Power parameter used in powered exponential kernel function. It must be $0 < \gamma \leq 2$ .
nu	Smoothness parameter of the Matern class. It must be a positive value.
useGradient	Logical. If TRUE, first derivatives will be used in the optimization.
rel.tol	Relative tolerance passed to nlminb(). Default to be $1e-10$ .
trace.iter	Print the processing of iterations of optimization.
fitting	Logical. If TRUE, fitting is carried out. Default to FALSE.

## Details

fyList is a list with items: 'time': a sequence of time points default to be 100 points from 0 to 1; 'nbasis': number of basis functions used in smoothing, default to be less than or equal to 23; 'norder': the order of the functional curves default to be 6; 'bSpline': logical, if TRUE, b-spline is used, otherwise use Fourier basis, default to be TRUE; 'Pen': default to be  $c(0,0)$ , meaning that the penalty is only applied to the second order derivative of the curve, with no penalty for the zero-th and first order derivatives of the curve; 'lambda': the smoothing parameter for the penalty, default to be  $1e-4$ .

fxList is similar to fyList. However, it is a list of lists to allow for different specifications for each functional covariate if there are multiple ones.

fbetaList, fbetaList\_l and fbetaList\_f are similar to each other. Each one is expected to be a list of lists. The items in each sub-list are: 'time': range of time, default to be 0 and 1; 'nbasis': number of basis functions used in smoothing, default to be less or equal to 19; 'norder': the order of the functional curves default to be 6; 'bSpline': logical, if TRUE (default), B-spline representation is used, otherwise Fourier basis is used; 'Pen': default to be  $c(0,0)$ ; 'lambda': default to be  $1e4$ ; 'bivar': logical, if TRUE, the bivariate basis will be calculated, otherwise normal basis, default to be FALSE; 'lambdas': the smoothing parameter for the penalty of the additional basis, default to be  $1e4$ .

Note that all items have default settings.

**Value**

A list containing:

**hyper** Estimated hyperparameters

**I** A vector of estimated standard deviation of hyperparameters

**modellist** List of FR models fitted before Gaussian process

**CovFun** Covariance function used

**gamma** Parameter 'gamma' used in Gaussian process with powered exponential kernel

**nu** Parameter 'nu' used in Gaussian process with Matern kernel

**init\_resp** Raw response data

**resid\_resp** Residual after the fitted values from FR models have been taken out

**fitted** Fitted values

**fitted.sd** Standard deviation of the fitted values

**ModelType** The type of the model applied in the function.

**lTrain** Training scalar covariates for the FR model

**fTrain** Training functional covariates for the FR model

**mfTrainfd** List of 'fd' objects from training data for FR model with functional covariates

**gpTrain** Training data for Gaussian Process

**time** Input time 't'

**iuuL** Inverse of covariance matrix for lReg

**iuuF** Inverse of covariance matrix for fReg

**fittedFM** Fitted values from the FR model

**fyList** fyList object used

**References**

- Ramsay, J., and Silverman, B. W. (2006), "Functional Data Analysis", 2nd ed., Springer, New York.
- Shi, J. Q., and Choi, T. (2011), "Gaussian Process Regression Analysis for Functional Data", CRC Press.

**Examples**

```
## See examples in vignette:
# vignette("gpfr", package = "GPFDA")
```

gpfrPredict

*Prediction of GPFR model***Description**

Make predictions for test input data based on the GPFR model learnt by the 'gpfr' function. Both type I and type II predictions can be made.

**Usage**

```
gpfrPredict(
  object,
  TestData,
  NewTime = NULL,
  lReg = NULL,
  fReg = NULL,
  gpReg = NULL,
  GP_predict = TRUE
)
```

**Arguments**

object	An object of class 'gpfr' obtained by the the 'gpfr' function.
TestData	Test input data. It must be a matrix or an 'fd' object.
NewTime	New time 't' for test data. If NULL, default settings will be applied.
lReg	The test scalar data for the FR model.
fReg	The test functional data for the FR model.
gpReg	List of three items. The names of the items must be 'response', 'input', 'time'. For type I prediction, 'response' is the observed response for a new batch, 'input' is the observed functional covariates for a new batch, 'time' is the observed time for the previous two. If NULL, type II prediction, will be carried out.
GP_predict	Logical. If TRUE (default), GP prediction is carried out; otherwise only functional prediction is carried out.

**Details**

If 'gpReg' is provided, then type I prediction is made. Otherwise, type II prediction is made.

**Value**

A list containing:

**ypred** matrix of predicted values with confidence intervals. The first column has the fitted values, while the second and third columns have the confidence interval bounds.

**ypred.mean** The mean values of the prediction.

**ypred.sd** The standard deviation of the predictions.

**time** Time 't' of test data.

**object** All items trained by 'gpfr'.

## Examples

```
## See examples in vignette:
# vignette("gpfr", package = "GPFDA")
```

---

gpr

*Gaussian Process regression*

---

## Description

Gaussian Process regression for a single or multiple independent realisations.

## Usage

```
gpr(
  input,
  response,
  Cov = "pow.ex",
  m = NULL,
  hyper = NULL,
  NewHyper = NULL,
  meanModel = 0,
  mu = NULL,
  gamma = 2,
  nu = 1.5,
  useGradient = T,
  iter.max = 100,
  rel.tol = 8e-10,
  trace = 0,
  nInitCandidates = 1000
)
```

## Arguments

input	Input covariates. It must be either a matrix, where each column represents a covariate, or a vector if there is only one covariate.
response	Response data. It should be a matrix, where each column is a realisation. It can be a vector if there is only one realisation.
Cov	Covariance function(s) to use. Options are: 'linear', 'pow.ex', 'rat.qu', and 'matern'. Default to 'power.ex'.
m	If Subset of Data is to be used, m denotes the subset size and cannot be larger than the total sample size. Default to NULL.
hyper	The hyperparameters. Default to NULL. If not NULL, then it must be a list with appropriate names.
NewHyper	Vector of names of the new hyperparameters of the customized kernel function. These names must have the format: xxxxxx.x, i.e. '6 digit' followed by 'a dot' followed by '1 digit'. This is required for both 'hyper' and 'NewHyper'
meanModel	Type of mean function. It can be <b>0</b> Zero mean function <b>1</b> Constant mean function to be estimated <b>'t'</b> Linear model for the mean function <b>'avg'</b> The average across replications is used as the mean function. This is only used if there are more than two realisations observed at the same input coordinate values. Default to 0. If argument 'mu' is specified, then 'meanModel' will be set to 'userDefined'.
mu	Mean function specified by the user. It must be a vector. Its length must be the same as the sample size, that is, nrow(response).
gamma	Power parameter used in powered exponential kernel function. It must be $0 < \gamma \leq 2$ .
nu	Smoothness parameter of the Matern class. It must be a positive value.
useGradient	Logical. If TRUE, first derivatives will be used in the optimization.
iter.max	Maximum number of iterations allowed. Default to 100. If 'rel.tol' is reduced, then the number of iterations needed will be less.
rel.tol	Relative convergence tolerance. Default to $8e-10$ . Smaller rel.tol means higher accuracy and more time to converge.
trace	The value of the objective function and the parameters is printed every trace'th iteration. Defaults to 0 which indicates no trace information is to be printed.
nInitCandidates	Number of initial hyperparameter vectors. The optimization starts with the best.

## Details

The most important function of the package. It fits the GPR model and stores everything necessary for prediction. The optimization used in the function is 'nlmminb'. The names for the hyperparameters should be: "linear.a" for linear covariance function, "pow.ex.w", "pow.ex.v" for power exponential, "rat.qu.s", "rat.qu.a" for rational quadratic, "matern.w", "matern.v" for Matern, "vv" for variance of Gaussian white noise. All hyperparameters should be in one list.

**Value**

A list containing:

**hyper** Hyperparameters vector estimated from training data

**var.hyper** Variance of the estimated hyperparameters

**fitted.mean** Fitted values for the training data

**fitted.sd** Standard deviation of the fitted values for the training data

**train.x** Training covariates

**train.y** Training response

**train.yOri** Original training response

**train.DataOri** Original training covariates

**idxSubset** Index vector identifying which observations were selected if Subset of Data was used.

**CovFun** Covariance function type

**gamma** Parameter used in powered exponential covariance function

**nu** Parameter used in Matern covariance function

**Q** Covariance matrix

**mean** Mean function

**meanModel** Mean model used

**meanLinearModel** 'lm' object if mean is a linear regression. NULL otherwise.

**conv** An integer. 0 means converge; 1 otherwise.

**hyper0** Starting point of the hyperparameters vector.

**References**

Shi, J. Q., and Choi, T. (2011), "Gaussian Process Regression Analysis for Functional Data", CRC Press.

**Examples**

```
## See examples in vignettes:

# vignette("gpr_ex1", package = "GPFDA")
# vignette("gpr_ex2", package = "GPFDA")
# vignette("co2", package = "GPFDA")
```

gprPredict

*Prediction using Gaussian Process***Description**

Prediction using Gaussian Process

**Usage**

```
gprPredict(
  train = NULL,
  input.new = NULL,
  noiseFreePred = F,
  hyper = NULL,
  input = NULL,
  Y = NULL,
  mSR = NULL,
  Cov = NULL,
  gamma = NULL,
  nu = NULL,
  meanModel = 0,
  mu = 0
)
```

**Arguments**

train	A 'gpr' object obtained from 'gpr' function. Default to NULL. If NULL, learning is done based on the other given arguments; otherwise, prediction is made based on the trained model of class gpr'.
input.new	Test input covariates. It must be either a matrix, where each column represents a covariate, or a vector if there is only one covariate.
noiseFreePred	Logical. If TRUE, predictions will be noise-free.
hyper	The hyperparameters. Default to NULL. If not NULL, then it must be a list with appropriate names.
input	Input covariates. It must be either a matrix, where each column represents a covariate, or a vector if there is only one covariate.
Y	Training response. It should be a matrix, where each column is a realisation. It can be a vector if there is only one realisation.
mSR	Subset size m if Subset of Regressors method is used for prediction. It must be smaller than the total sample size.
Cov	Covariance function(s) to use. Options are: 'linear', 'pow.ex', 'rat.qu', and 'matern'. Default to 'power.ex'.
gamma	Power parameter used in powered exponential kernel function. It must be $0 < \text{gamma} \leq 2$ .
nu	Smoothness parameter of the Matern class. It must be a positive value.

meanModel	<p>Type of mean function. It can be</p> <ul style="list-style-type: none"> <li><b>0</b> Zero mean function</li> <li><b>1</b> Constant mean function to be estimated</li> <li><b>'t'</b> Linear model for the mean function</li> <li><b>'avg'</b> The average across replications is used as the mean function. This is only used if there are more than two realisations observed at the same input coordinate values.</li> </ul> <p>Default to 0. If argument 'mu' is specified, then 'meanModel' will be set to 'userDefined'.</p>
mu	<p>Mean function specified by the user. It must be a vector. Its length must be the same as the sample size, that is, nrow(response).</p>

### Value

A list containing

- pred.mean** Mean of predictions
- pred.sd** Standard deviation of predictions
- newdata** Test input data
- noiseFreePred** Logical. If TRUE, predictions are noise-free.
- ... Objects of 'gpr' class.

### Examples

```
## See examples in vignettes:

# vignette("gpr_ex1", package = "GPFDA")
# vignette("gpr_ex2", package = "GPFDA")
# vignette("co2", package = "GPFDA")
```

---

mat2fd	<i>Create an 'fd' object from a matrix</i>
--------	--

---

### Description

Easy setting up for creating an 'fd' object

### Usage

```
mat2fd(mat, fdList = NULL)
```

## Arguments

<b>mat</b>	Input data, should be a matrix with ncol time points and nrow replications or samples.
<b>fdList</b>	A list with following items: <ul style="list-style-type: none"> <li><b>time</b> Sequence of time points (default to be 100 points from 0 to 1).</li> <li><b>nbasis</b> Number of basis functions used in smoothing, default to be less or equal to 23.</li> <li><b>norder</b> Order of the functional curves default to be 6.</li> <li><b>bSpline</b> Logical, if TRUE (default), b-Spline basis is used; otherwise, Fourier basis is used.</li> <li><b>Pen</b> Default to be c(0,0), meaning that the penalty is on the second order derivative of the curve, since the weight for zero-th and first order derivatives of the curve are set to zero.</li> <li><b>lambda</b> Smoothing parameter for the penalty. Default to be 1e-4.</li> </ul>

## Details

All items listed above have default values. If any item is required to change, add that item into the list; otherwise, leave it as NULL. For example, if one only wants to change the number of basis functions, do: `mat2fd(SomeMatrix, list(nbasis=21))`

## Value

An 'fd' object

## References

Shi, J. Q., and Choi, T. (2011), "Gaussian Process Regression Analysis for Functional Data", CRC Press.

## Examples

```
require(fda)
ry <- rnorm(20, sd=10)
y1 <- matrix(NA, ncol=100, nrow=20)
for(i in 1:20) y1[i,] <- sin(seq(-1,pi,len=100))*ry[i]

y1fd <- mat2fd(y1)
y1fd <- mat2fd(y1, list(lambda=1))
```

---

mgpCovMat	<i>Calculate a multivariate Gaussian processes covariance matrix given a vector of hyperparameters</i>
-----------	--

---

**Description**

Calculate a multivariate Gaussian processes covariance matrix given a vector of hyperparameters

**Usage**

```
mgpCovMat(Data, hp)
```

**Arguments**

Data	List of two elements: 'input' and 'response'. The element 'input' is a list of N vectors, where each vector represents the input covariate values for a particular output. The element 'response' is the corresponding list of N matrices (if there are multiple realisations) or vectors (for a single realisation) representing the response variables.
hp	Vector of hyperparameters

**Value**

Covariance matrix

**References**

Shi, J. Q., and Choi, T. (2011), "Gaussian Process Regression Analysis for Functional Data", CRC Press.

**Examples**

```
## See examples in vignette:
# vignette("mgpr", package = "GPFDA")
```

---

mgpr	<i>Multivariate Gaussian process regression</i>
------	---

---

**Description**

Multivariate Gaussian process regression where each of the N outputs is unidimensional. The multivariate output is allowed to have multiple independent realisations.

**Usage**

```
mgpr(Data, m = NULL, meanModel = 0, mu = NULL)
```

## Arguments

<code>Data</code>	List of two elements: 'input' and 'response'. The element 'input' is a list of N vectors, where each vector represents the input covariate values for a particular output. The element 'response' is the corresponding list of N matrices (if there are multiple realisations) or vectors (for a single realisation) representing the response variables.
<code>m</code>	If Subset of Data is to be used in the estimation, m denotes the subset size. It cannot be larger than the total sample size. Default to NULL (Subsetting is not used).
<code>meanModel</code>	Type of mean function applied to all outputs. It can be <b>0</b> Zero mean function for each output. <b>1</b> Constant mean function to be estimated for each output. <b>'t'</b> Linear model for the mean function of each output. <b>'avg'</b> The average across replications is used as the mean function of each output. This can only be used if there are more than two realisations observed at the same input values. Default to 0. If argument 'mu' is specified, then 'meanModel' will be set to 'userDefined'.
<code>mu</code>	Vector of concatenated mean function values defined by the user. Default to NULL.

## Value

A list containing:

**fitted.mean** Fitted values for the training data

**fitted.sd** Standard deviation of the fitted values for training data

**N** Number of response variables

**X** Original input variables

**Y** Original response

**idx** Index vector identifying to which output the elements of concatenated vectors correspond to.

**Cov** Covariance matrix

**mean** Concatenated mean function

**meanModel** Mean model used for each output

**meanLinearModel** 'lm' object for each output if the linear regression model is used for the mean functions. NULL otherwise.

## References

## Examples

```
## See examples in vignette:
# vignette("mgpr", package = "GPFDA")
```

mgprPredict

*Prediction of multivariate Gaussian process***Description**

Prediction of multivariate Gaussian process

**Usage**

```
mgprPredict(
  train,
  Data.obs = NULL,
  Data.new,
  noiseFreePred = F,
  meanModel = NULL,
  mu = 0
)
```

**Arguments**

<code>train</code>	A 'mgpr' object obtained from 'mgpr' function. If NULL, predictions are made based on Data.obs informed by the user.
<code>Data.obs</code>	List of observed data. Default to NULL. If NULL, predictions are made based on the trained data (included in the object of class 'mgpr') used for learning.
<code>Data.new</code>	List of test input data.
<code>noiseFreePred</code>	Logical. If TRUE, predictions will be noise-free.
<code>meanModel</code>	Type of mean function applied to all outputs. It can be <b>0</b> Zero mean function for each output. <b>1</b> Constant mean function to be estimated for each output. <b>'t'</b> Linear model for the mean function of each output. <b>'avg'</b> The average across replications is used as the mean function of each output. This can only be used if there are more than two realisations observed at the same input values. Default to 0. If argument 'mu' is specified, then 'meanModel' will be set to 'userDefined'.
<code>mu</code>	Vector of concatenated mean function values defined by the user. Default to NULL.

**Value**

A list containing

**pred.mean** Mean of predictions for the test set.

**pred.sd** Standard deviation of predictions for the test set.

**noiseFreePred** Logical. If TRUE, predictions are noise-free.

**Examples**

```
## See examples in vignette:
# vignette("mgpr", package = "GPFDA")
```

---

nsgpCovMat	<i>Calculate a NSGP covariance matrix given a vector of hyperparameters</i>
------------	---

---

**Description**

Calculate a NSGP covariance matrix given a vector of hyperparameters

**Usage**

```
nsgpCovMat(
  hp,
  input,
  inputSubsetIdx = NULL,
  nBasis = 5,
  corrModel = corrModel,
  gamma = NULL,
  nu = NULL,
  cyclic = NULL,
  whichTau = NULL,
  calcCov = T
)
```

**Arguments**

hp	Vector of hyperparameters estimated by function nsgpr.
input	List of Q input variables (see Details).
inputSubsetIdx	A list identifying a subset of the input values to be used in the estimation (see Details).
nBasis	Number of B-spline basis functions in each coordinate direction along which parameters change.
corrModel	Correlation function specification used for g(.). It can be either "pow.ex" or "matern".
gamma	Power parameter used in powered exponential kernel function. It must be $0 < \gamma \leq 2$ .
nu	Smoothness parameter of the Matern class. It must be a positive value.
cyclic	Logical vector of dimension Q which defines which covariates are cyclic (periodic). For example, if basis functions should be cyclic only in the first coordinate direction, then <code>cyclic=c(T,F)</code> . <code>cyclic</code> must have the same dimension of <code>whichTau</code> . If <code>cyclic</code> is TRUE for some coordinate direction, then cyclic B-spline functions will be used and the varying parameters (and their first two derivatives) will match at the boundaries of that coordinate direction.

<code>whichTau</code>	Logical vector of dimension Q identifying which input coordinates the parameters are function of. For example, if Q=2 and parameters change only with respect to the first coordinate, then we set <code>whichTau=c(T,F)</code> .
<code>calcCov</code>	Logical. Calculate covariance matrix or not. If FALSE, time or spatially-varying parameters are still provided.

**Value**

A list containing

**Cov** Covariance matrix

**vareps** Noise variance

**As\_perTau** List of varying anisotropy matrix over the input space

**sig2\_perTau** Vector of signal variance over the input space

**References**

Konzen, E., Shi, J. Q. and Wang, Z. (2020) "Modeling Function-Valued Processes with Nonseparable and/or Nonstationary Covariance Structure" <arXiv:1903.09981>.

**Examples**

```
## See examples in vignette:
# vignette("nsgpr", package = "GPFDA")
```

---

nsgpCovMatAsym

---

*Calculate an asymmetric NSGP covariance matrix*

---

**Description**

Calculate an asymmetric NSGP covariance matrix

**Usage**

```
nsgpCovMatAsym(
  hp,
  input,
  inputNew,
  nBasis = 5,
  corrModel = corrModel,
  gamma = NULL,
  nu = NULL,
  cyclic = NULL,
  whichTau = NULL
)
```

**Arguments**

hp	Vector of hyperparameters estimated by function nsgpr.
input	List of Q input variables (see Details).
inputNew	List of Q test set input variables.
nBasis	Number of B-spline basis functions in each coordinate direction along which parameters change.
corrModel	Correlation function specification used for g(.). It can be either "pow.ex" or "matern".
gamma	Power parameter used in powered exponential kernel function. It must be $0 < \gamma \leq 2$ .
nu	Smoothness parameter of the Matern class. It must be a positive value.
cyclic	Logical vector of dimension Q which defines which covariates are cyclic (periodic). For example, if basis functions should be cyclic only in the first coordinate direction, then <code>cyclic=c(T,F)</code> . <code>cyclic</code> must have the same dimension of <code>whichTau</code> . If <code>cyclic</code> is TRUE for some coordinate direction, then cyclic B-spline functions will be used and the varying parameters (and their first two derivatives) will match at the boundaries of that coordinate direction.
whichTau	Logical vector of dimension Q identifying which input coordinates the parameters are function of. For example, if $Q=2$ and parameters change only with respect to the first coordinate, then we set <code>whichTau=c(T,F)</code> .

**Value**

An asymmetric covariance matrix

**References**

Konzen, E., Shi, J. Q. and Wang, Z. (2020) "Modeling Function-Valued Processes with Nonseparable and/or Nonstationary Covariance Structure" <arXiv:1903.09981>.

---

nsgpr	<i>Estimation of a nonseparable and/or nonstationary covariance structure</i>
-------	---

---

**Description**

Estimate the covariance structure of a zero-mean Gaussian Process with Q-dimensional input coordinates (covariates).

Multiple realisations for the response variable can be used, provided they are observed on the same grid of dimension  $n_1 \times n_2 \times \dots \times n_Q$ .

Let  $n = n_1 \times n_2 \times \dots \times n_Q$  and let nSamples be the number of realisations.

**Usage**

```
nsgpr(
  response,
  input,
  inputSubsetIdx = NULL,
  corrModel = "pow.ex",
  gamma = 2,
  nu = 1.5,
  whichTau = NULL,
  nBasis = 5,
  cyclic = NULL,
  unitSignalVariance = F,
  zeroNoiseVariance = F,
  sepCov = F,
  nInitCandidates = 300,
  absBounds = 6
)
```

**Arguments**

response	Response variable. This should be a (n x nSamples) matrix where each column is a realisation
input	List of Q input variables (see Details).
inputSubsetIdx	A list identifying a subset of the input values to be used in the estimation (see Details).
corrModel	Correlation function specification used for g(.). It can be either "pow.ex" or "matern".
gamma	Power parameter used in powered exponential kernel function. It must be $0 < \gamma \leq 2$ .
nu	Smoothness parameter of the Matern class. It must be a positive value.
whichTau	Logical vector of dimension Q identifying which input coordinates the parameters are function of. For example, if Q=2 and parameters change only with respect to the first coordinate, then we set whichTau=c(T,F).
nBasis	Number of B-spline basis functions in each coordinate direction along which parameters change.
cyclic	Logical vector of dimension Q which defines which covariates are cyclic (periodic). For example, if basis functions should be cyclic only in the first coordinate direction, then cyclic=c(T,F). cyclic must have the same dimension of whichTau. If cyclic is TRUE for some coordinate direction, then cyclic B-spline functions will be used and the varying parameters (and their first two derivatives) will match at the boundaries of that coordinate direction.
unitSignalVariance	Logical. TRUE if we assume realisations have variance 1. This is useful when we want to estimate an NSGP correlation function.
zeroNoiseVariance	Logical. TRUE if we assume the realisations are noise-free.

sepCov	Logical. TRUE only if we fix to zero all off-diagonal elements of the varying anisotropy matrix. Default to FALSE, allowing for a separable covariance function.
nInitCandidates	number of initial hyperparameter vectors which are used to evaluate the log-likelihood function at a first step. After evaluating the log-likelihood using these 'nInitCandidates' vectors, the optimisation via nlminb() begins with the best of these vectors.
absBounds	lower and upper boundaries for B-spline coefficients (if wanted).

## Details

The input argument for Q=2 can be constructed as follows:

```
n1 <- 10
n2 <- 1000
input <- list()
input[[1]] <- seq(0,1,length.out = n1)
input[[2]] <- seq(0,1,length.out = n2)
```

If we want to use every third lattice point in the second input variable (using Subset of Data), then we can set

```
inputSubsetIdx <- list()
inputSubsetIdx[[1]] <- 1:n1
inputSubsetIdx[[2]] <- seq(1,n2, by=3)
```

## Value

A list containing:

**MLEsts** Maximum likelihood estimates of B-spline coefficients and noise variance.

**response** Matrix of response.

**inputMat** Input coordinates in a matrix form

**corrModel** Correlation function specification used for g(.)

## References

nsgprPredict	<i>NSGP prediction given a vector of hyperparameters</i>
--------------	--

---

### Description

NSGP prediction given a vector of hyperparameters

### Usage

```
nsgprPredict(
  hp,
  response,
  input,
  input.new,
  noiseFreePred = F,
  nBasis = nBasis,
  corrModel = corrModel,
  gamma = gamma,
  nu = nu,
  cyclic = cyclic,
  whichTau = whichTau
)
```

### Arguments

hp	Vector of hyperparameters estimated by function nsgpr.
response	Response variable. This should be a (n x nSamples) matrix where each column is a realisation
input	List of Q input variables (see Details).
input.new	List of Q test set input variables.
noiseFreePred	Logical. If TRUE, predictions will be noise-free.
nBasis	Number of B-spline basis functions in each coordinate direction along which parameters change.
corrModel	Correlation function specification used for g(.). It can be either "pow.ex" or "matern".
gamma	Power parameter used in powered exponential kernel function. It must be $0 < \text{gamma} \leq 2$ .
nu	Smoothness parameter of the Matern class. It must be a positive value.
cyclic	Logical vector of dimension Q which defines which covariates are cyclic (periodic). For example, if basis functions should be cyclic only in the first coordinate direction, then <code>cyclic=c(T,F)</code> . <code>cyclic</code> must have the same dimension of <code>whichTau</code> . If <code>cyclic</code> is TRUE for some coordinate direction, then cyclic B-spline functions will be used and the varying parameters (and their first two derivatives) will match at the boundaries of that coordinate direction.
whichTau	Logical vector of dimension Q identifying which input coordinates the parameters are function of. For example, if <code>Q=2</code> and parameters change only with respect to the first coordinate, then we set <code>whichTau=c(T,F)</code> .

**Value**

A list containing

**pred.mean** Mean of predictions for the test set.

**pred.sd** Standard deviation of predictions for the test set.

**noiseFreePred** Logical. If TRUE, predictions are noise-free.

**Examples**

```
## See examples in vignette:
# vignette("nsgpr", package = "GPFDA")
```

---

plot.gpfr	<i>Plot GPFR model for either training or prediction</i>
-----------	--

---

**Description**

Plot GPFR model for either training or prediction

**Usage**

```
## S3 method for class 'gpfr'
plot(
  x,
  type = c("raw", "meanFunction", "fitted", "prediction"),
  ylab = "y",
  xlab = "t",
  ylim = NULL,
  realisations = NULL,
  ...
)
```

**Arguments**

x	Plot GPFR for training or prediction from a given object of 'gpfr' class.
type	Required type of plots. Options are: 'raw', 'meanFunction', 'fitted' and 'prediction'.
ylab	Title for the y axis.
xlab	Title for the x axis.
ylim	Graphical parameter. If NULL (default), it is chosen automatically.

realisations	Index vector identifying which training realisations should be plotted. If NULL (default), all training realisations are plotted. For predictions, 'realisations' should be '0' if no training realisation is to be plotted.
...	Other graphical parameters passed to plot().

**Value**

A plot.

**Examples**

```
## See examples in vignette:
# vignette("gpfr", package = "GPFDA")
```

---

plot.gpr

---

*Plot Gaussian Process regression – training and prediction*

---

**Description**

Plot Gaussian Process for a given an object of class 'gpr'.

**Usage**

```
## S3 method for class 'gpr'
plot(
  x,
  fitted = F,
  col.no = 1,
  ylim = NULL,
  realisation = NULL,
  main = NULL,
  cex.points = NULL,
  lwd.points = NULL,
  pch = NULL,
  lwd = NULL,
  ...
)
```

**Arguments**

x	The 'gpr' object from either training or predicting of the Gaussian Process.
fitted	Logical. Plot fitted values or not. Default to FALSE. If FALSE, plot the predictions.
col.no	Column number of the input matrix. If the input matrix has more than one columns, than one of them will be used in the plot. Default to be the first one.
ylim	Range value for y-axis.

realisation	Integer identifying which realisation should be plotted (if there are multiple).
main	Title for the plot
cex.points	Graphical parameter
lwd.points	Graphical parameter
pch	Graphical parameter
lwd	Graphical parameter
...	Graphical parameters passed to plot().

**Value**

A plot

**Examples**

```
## See examples in vignette:
# vignette("gpr_ex1", package = "GPFDA")
```

---

plot.mgpr

---

*Plot predictions of a multivariate Gaussian Process regression model*

---

**Description**

Plot predictions of each element of the multivariate Gaussian Process for a given an object of class 'mgpr'.

**Usage**

```
## S3 method for class 'mgpr'
plot(
  x,
  Data.obs,
  Data.new,
  realisation,
  ylim = NULL,
  mfrow = NULL,
  cex = 2,
  cex.lab = 2,
  cex.axis = 2,
  ...
)
```

**Arguments**

<code>x</code>	An object of class 'mgpr'
<code>Data.obs</code>	List of observed data
<code>Data.new</code>	List of test data
<code>realisation</code>	Index identifying which realisation should be plotted.
<code>ylim</code>	Range of y-axis
<code>mfrow</code>	Graphical parameter
<code>cex</code>	Graphical parameter
<code>cex.lab</code>	Graphical parameter
<code>cex.axis</code>	Graphical parameter
<code>...</code>	Graphical parameters passed to <code>plot()</code> .

**Value**

A plot showing predictions of each element of the multivariate process.

**Examples**

```
## See examples in vignette:
# vignette("mgpr", package = "GPFDA")
```

---

plotImage

---

*Draw an image plot for a given two-dimensional input*

---

**Description**

Draw an image plot for a given two-dimensional input

**Usage**

```
plotImage(
  response,
  input,
  realisation = 1,
  n1,
  n2,
  main = " ",
  xlim = NULL,
  cex.axis = 1,
  cex.lab = 2.5,
  legend.cex.axis = 1,
  font.main = 2,
  cex.main = 2,
  legend.width = 2,
```

```

    mar = c(2.1, 2.1, 3.1, 6.1),
    oma = c(0, 1, 0, 0),
    nGrid = 200,
    enlarge_zlim = NULL
  )

```

### Arguments

response	Data to be plotted (e.g. matrix of predictions)
input	Matrix of two columns representing the input coordinates.
realisation	Integer identifying which realisation should be plotted (if there are multiple).
n1	Number of datapoints in the first coordinate direction
n2	Number of datapoints in the second coordinate direction
main	Title for the plot
zlim	Range of z-axis
cex.axis	Graphical parameter
cex.lab	Graphical parameter
legend.cex.axis	Graphical parameter
font.main	Graphical parameter
cex.main	Graphical parameter
legend.width	Graphical parameter
mar	Graphical parameter
oma	Graphical parameter
nGrid	Dimension of output grid in each coordinate direction
enlarge_zlim	Additional quantity to increase the range of zlim

### Value

A plot

### Examples

```

## See examples in vignette:
# vignette("gpr_ex2", package = "GPFDA")

```

---

plotmgpCovFun	<i>Plot auto- or cross-covariance function of a multivariate Gaussian process</i>
---------------	---

---

### Description

Plot auto- or cross-covariance function of a multivariate Gaussian process

### Usage

```
plotmgpCovFun(
  type = "Cov",
  output,
  outputp,
  Data,
  hp,
  idx,
  ylim = NULL,
  xlim = NULL
)
```

### Arguments

type	Logical. It can be either 'Cov' (for covariance function) or 'Cor' (for corresponding correlation function).
output	Integer identifying one element of the multivariate process.
outputp	Integer identifying one element of the multivariate process. If 'output' and 'outputp' are the same, the auto-covariance function will be plotted. Otherwise, the cross-covariance function between 'output' and 'outputp' will be plotted.
Data	List of two elements: 'input' and 'response'. The element 'input' is a list of N vectors, where each vector represents the input covariate values for a particular output. The element 'response' is the corresponding list of N matrices (if there are multiple realisations) or vectors (for a single realisation) representing the response variables.
hp	Vector of hyperparameters
idx	Index vector identifying to which output the elements of concatenated vectors correspond to.
ylim	Graphical parameter
xlim	Graphical parameter

### Value

A plot

**Examples**

```
## See examples in vignette:
# vignette("mgpr", package = "GPFDA")
```

---

unscaledCorr	<i>Calculate an unscaled NSGP correlation matrix</i>
--------------	--

---

**Description**

Calculate an unscaled NSGP correlation matrix

**Usage**

```
unscaledCorr(Dist.mat, corrModel, gamma = NULL, nu = NULL)
```

**Arguments**

Dist.mat	Distance matrix
corrModel	Correlation function specification used for g(.). It can be either "pow.ex" or "matern".
gamma	Power parameter used in powered exponential kernel function. It must be $0 < \gamma \leq 2$ .
nu	Smoothness parameter of the Matern class. It must be a positive value.

**Value**

A matrix
